AB Described is a method for making a pharmaceutical preparation comprising the solubilization of a peptide mixture, characterized in that the peptide mixture is solubilized by an aqueous solution containing at least one organic

acid selected from the group consisting of formic acid, acetic acid, propionic acid, butyric acid and halogenated or hydroxylated forms thereof.

- AB The invention refers to an improved vaccine against infections with pathogens, especially viral pathogens, comprising an antigen, a peptide of the formula R1-XZXZN-XZX-R2 and an immunostimulatory deoxynucleic acid containing deoxyinosine and/or deoxyuridine residues. Prepared were influenza vaccine compns. and hepatitis B vaccine compns.

DOCUMENT TYPE: Journal LANGUAGE: Chinese

The serum HSP70 in patients with hepatitis C was detected and its role in cytotoxicity of specific CTLs induced by HSP70-HCV peptide complex was evaluated. The serum HSP70 level in patients infected with HCV and normal individuals were detected by ELISA. The relationship between anti-HCV antibody and HSP70 was evaluated. Peripheral blood mononuclear cells (PBMCs) were activated by HSP70-HCV peptide complex and then 4 h 51Cr release assay were used to detect the killer activity of CTLs. Detection rates of HSP70 were 82.1% (22/28) and 18.8% (9/48) in patients with anti-HCV antibody and in normal individuals, resp. There was significant correlation between the detection rate of HSP70 and HCV infection ($\chi 2=28.77$, P<0.01). The level of serum HSP70 in patients infected with HCV was markedly more higher than that in normal individuals. CTLs from one patient induced by HSP70-HCV C region peptide (DLMGYIPAV) complex could lyse autologous B lymphoblastoid cell lines (BLcLs) with killer rate of 37.8%, whereas CTLs induced by peptide alone could not lyse autologous BLcLs cells. HCV infection can induce over expression of HSP70. HSP70 may have the action of enhancing presentation of HCV epitope peptide and promoting clearance cells infected with HCV.

The present invention provides (1) an isolated peptide having the AΒ amino acid sequence DLMGYIPAV, (SEQ ID NO: 1); (2) an isolated HCV core polypeptide comprising an $L \rightarrow A$ substitution at amino acid position 139; (3) an isolated HCV core polypeptide having the amino acid sequence of SEQ ID NO: 2; and (4) a fragment of an HCV core polypeptide having fewer amino acids than the entire HCV core polypeptide and comprising the amino acid sequence SEQ ID NO: 1. provided are nucleic acids which encode the peptides and polypeptides of this invention, vectors comprising the nucleic acids of this invention and cells comprising the vectors and nucleic acids of this invention. The present invention further provides methods of producing an immune response in a subject and/or treating or preventing HCV infection in a subject, comprising administering to the subject, or to a cell of the subject, any of the compns. of this invention. The present invention also provides methods for determining a viral load and prognosis of a subject diagnosed with hepatitis C virus infection.

Since the natural immune response to hepatitis C virus (HCV) is often unable to clear the infection, to enhance immunogenicity we studied substituted peptides from an HCV cytotoxic T lymphocyte (CTL) epitope (C7A2) from a conserved region of the HCV core protein (DLMGYIPLV) recognized by CTL lines from HLA-A2.1+ HCV-infected patients and HLA-A2.1 transgenic mice. HLA-A2.1 binding, human and murine CTL recognition, and in vivo immunogenicity (using mice transgenic for human HLA-A2 in lieu of immunizing humans) were analyzed to define peptides with enhanced immunogenicity. Peptides substituted at position 1 showed enhanced HLA-A2 binding affinity, but paradoxically poorer immunogenicity. A peptide with Ala substituted at position 8 (8A) showed higher HLA-A2 binding affinity and CTL recognition and was a more potent in vivo immunogen in HLA-A2-transgenic mice, inducing higher CTL responses with higher avidity against native C7A2 than induced by C7A2 itself. These results suggest that peptide 8A is a more potent in vitro antigen and in vivo immunogen than C7A2 and may be useful as a vaccine component. They provide proof of principle that the strategy of epitope enhancement can enhance immunogenicity of a CTL epitope recognized by human CTL.

This study was performed to test the hypothesis that cytotoxic T lymphocyte (CTL) selection of hepatitis C virus (HCV) escape variants plays a role in HCV persistence. The peripheral blood CTL responsiveness of patients with well-established chronic hepatitis C to a panel of 10 prototype HCV peptides (genotype 1a) was compared with the corresponding sequences encoded by the infecting viruses in each patient. Variant viral peptide sequences were threefold more frequent in the presence of a CTL response than in its absence, and CTL responses were detected nearly twice as often in association with variant rather than with prototype viral peptide sequences. Furthermore, over half of the patients were infected with potential CTL escape variants that contained nonimmunogenic and noncross-reactive variant peptides many of which displayed reduced HLA-binding affinity. Surprisingly, follow up anal. over a period of up to 46 mo revealed that, in contrast to the relatively high frequency of escape variants initially observed, the subsequent emergence rate of CTL escape variants was very low. Interestingly, the one escape variant that was detected proved to be a CTL antagonist. Collectively, these observations suggest that CTL selection of epitope variants may have occurred in these patients before their entrance into the study and that it may have played a role in HCV persistence. The low apparent rate of ongoing CTL selection in chronically infected patients, however, suggests that if CTL escape occurs during HCV infection it is probably an early event.

response fragments of the Hepatitis C virus (HCV) core polypeptide can be used to elicit an immune response. A cytotoxic T-lymphocyte (CTL) cesponse is present in patients acutely and chronically infected by HCV.

CTL's recognise viral antigens as peptides presented by Class I molecules of the major histocompatability complex (MHC). These peptide antigens are cypically and acids long. These peptide antigens rypically have a sequence pattern or motif depending upon which particular MHC antigen they are bound and presented by. The motifs are based on the presence in they are bound and presented by. The motifs are based on the presence in they are bound and machor residues, responsible for interactions care poptide and mHC molecule, as well as other secondary position between peptide and MHC molecule, as well as other secondary position charges within the peptide sequence can enhance the immune response. Peptides derived from the HCV core polypeptide having substituted amino acid suthin their sequence can enhance the immune response against HCV. They can therefore be used as a vaccine or for treating HCV infection. This peptide is a fragment of the substituted HCV core polypeptide and comprises the region of amino acids within that polypeptide from position 132 to position 140 which contains the amino acid substitution

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a pharmaceutical composition comprising (a) an antigen; (b) an immunostimulating substance consisting of neuroactive compounds, hormones, compounds having growth hormone activity or their mixtures; and (c) a polycationic polymer. The present sequence is an antigenic peptide derived from Hepatitis c virus, which was used in the present invention. The composition is useful in manufacturing vaccines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a vaccine (V1) for preventing viral infections comprises an antigen, a peptide comprising a sequence R1-XZXZXXZX-R2, where N is 3-7 (preferably 5); X is positively charged natural and/or non natural amino acid residue; Z is amino acid residue chosen from Leu, Val, Ile, Phe and/or Trp; R1 and R2 is chosen from H. -NR2, -COCH3, COCH3, a peptide with up to 20 amino acid residues or peptide reactive group or peptide linker with or without peptide, and X-R2 may be an amide, ester or thioester of the C-rerminal amino acid residue of the peptide (Peptide A); and an immunostimulatory oligodeoxymucleic acid molecule (DND), (V1) is useful for preventing viral infections cost by influenza virus, HBV, HCV, HPV or JBV. A mixture of Peptide A and a I-/U-ODN (PI) is useful for improving the protective efficacy of (V1). This sequence corresponds to peptide p87 derived from hepatitis C virus protein and used in the vaccine of the invention to generate HCV-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Sequence 9 AA;

The invention relates to a Hepatitis C virus (HCV) vaccine (VA) comprising at least two epitopes, each from a different hotspot epitope, where a hotspot epitope is defined as an epitope containing peptide having specific sequences. As included is the preparation of VA, involving chemically synthesizing the two epitopes of VA, solubilizing the epitopes by an aqueous solution containing an organic acid chosen from formic acid, acetic acid, propionic acid, butyric acid and its halogenated or hydroxylated forms, mixing the solubilized epitopes and preparation of a medicament for the prevention and treatment of an infection with HCV. The present sequence is an HCV epitope peptide derived from a hotspot epitope, used as a vaccine.

                                                                                                                                                                                                 용
                                                                                                                                                                      ઠે
                                                                      The invention relates to a Hepatitis C virus (HCV) vaccine (VA) comprising at least two epitopes, each from a different hotspot epitope, where a hotspot epitope is defined as an epitope containing peptide having specific sequences. Also included is the preparation of VA, involving chemically synthesizing the two epitopes of VA, solubilizing the epitopes by an aqueous solution containing an organic acid chosen from formic acid, acetic acid, propionic acid, butyric acid and its halogenated or hydroxylated forms, mixing the solubilized epitopes and optionally lyophilizing the mixed epitopes. The vaccine is useful for the preparation of a medicament for the prevention and treatment of an infection with HCV. The present sequence is an HCV epitope peptide derived from a hotspot epitope, used as a vaccine.

The invention relates to a Hepatitis C virus (HCV) vaccine (VA) comprising at least two epitopes, each from a different hotspot epitope, where a hotspot epitope is defined as an epitope containing peptide having specific sequences. Also included is the preparation of VA, involving chemically synthesizing the two epitopes of VA, solubilizing the epitopes by an aqueous solution containing an organic acid chosen from formic acid, acetic acid, propionic acid, butyric acid and itse halogenated or hydroxylated forms, mixing the solubilized epitopes and optionally lyophilizing the mixed epitopes. The vaccine is useful for the preparation of a medicaement for the prevention and treatment of an infection with HCV. The present sequence is an HCV epitope peptide derived from a hotspot epitope, used as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a Hepatitis C virus (HCV) vaccine (VA) comprising at least two epitopes, each from a different hotspot epitope, where a hotspot epitope is defined as an epitope containing peptide having specific sequences. Also included is the preparation of VA, involving chemically synthesizing the two epitopes of VA, solubilizing from formic acid, an aqueous solution containing an organic acid chosen from formic acid, acetic acid, propionic acid, butyric acid and its halogenated or hydroxylated forms, mixing the solubilized epitopes and optionally lyophilizing the mixed epitopes. The vaccine is useful for the preparation of a medicament for the prevention and treatment of an infection with HCV. The present sequence is an HCV epitope peptide derived from a hotspot epitope, used as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

```
The invention relates to a Hepatitis C virus (HCV) vaccine (VA) comprising at least two epitopes, each from a different hotspot epitope, where a hotspot epitope is defined as an epitope containing peptide having specific sequences. Also included is the preparation of VA, involving chemically synthesizing the two epitopes of VA, solubilizing the epitopes by an aqueous solution containing an organic acid chosen from formic acid, acetic acid, propionic acid, butyric acid and its halogenated or hydroxylated forms, mixing the solubilized epitopes and optionally lyophilizing the mixed epitopes. The vaccine is useful for the preparation of a medicament for the prevention and treatment of an infection with HCV. The present sequence is an HCV epitope peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                    The invention relates to a Hepatitis C virus (HCV) vaccine (VA) comprising at least two epitopes, each from a different hotspot epitope, where a hotspot epitope is defined as an epitope containing peptide having specific sequences. Also included is the preparation of VA, involving chemically synthesizing the two epitopes of VA, solubilizing from formic acid, acetic acid, propionic acid, butyric acid chosen from formic acid, acetic acid, propionic acid, butyric acid and its halogenated or hydroxylated forms, mixing the solubilized epitopes and optionally lyophilizing the mixed epitopes. The vaccine is useful for the preparation of a medicament for the prevention and treatment of an infection with HCV. The present sequence is an HCV epitope peptide derived from a hotspot epitope, used as a vaccine.
                                                                                                        Hepatitis C virus HCV vaccine useful for preparation of medicament for prevention and treatment of infection with HCV, comprises two epitopes from different hotspot epitope containing specific peptide.

Peptide fragments of the Hepatitis C virus (HCV) core polypeptide can be used to elicit an immune response. A cyctocxic T-lymphocyce (CTL) response is present in patients acutely and chronically infected by HCV.

CTL's recognise viral antigens as peptides presented by Class I molecules of the major histocompatability complex (MHC). These peptide antigens are cypically along and acids long. These peptide antigens typically have a sequence pattern or motif depending upon which particular MHC antigen they are bound and presented by. The motifs are based on the presence in they are bound and presented by. The motifs are based on the presence in they are bound and presented by. The motifs are based on the presence in they are postide and anchor residues, responsible for interactions between peptide and mHC molecule, as well as other secondary position to that may help to stabilise the interaction. Thus, single amino acid changes within the peptide sequence can enhance the immune response. Peptides derived from the HV core polypeptide having substituted amino acid acids within their sequence, specifically a a hepatitis C virus core polypeptide comprising an L to an A substitution at amino acid position 139 enhance the immune response against HVV. They can therefore be used as a vaccine or for treating HCV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel expression vector pBVTB with the property of immunological adjuvant. The vector includes most of the sequence of plasmid Pbv220 and some small molecular immunological adjuvant genes. The present invention also discloses the genetic engineering process of preparing PBVTB, and the application of combining pBVTB and a HIV high conservative T cell epitope gene in a hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New expression vector pBVTB for use in a hepatitis C vaccine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a Hepatitis C virus (HCV) vaccine (VA) comprising at least two epitopes, each from a different hotspot epitope, where a hotspot epitope is defined as an epitope containing peptide having specific sequences. Also included is the preparation of VA, involving chemically synthesizing the two epitopes of VA, solubilizing the epitopes by an aqueous solution containing an organic acid chosen from formic acid, acetic acid, propionic acid, butyric acid and its halogenated or hydroxylated forms, mixing the solubilized epitopes and optionally lyophilizing the mixed epitopes. The vaccine is useful for the preparation of a medicament for the prevention and treatment of an infection with HCV. The present sequence is an HCV hotspot epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hepatitis C virus HCV vaccine useful for preparation of medicament for prevention and treatment of infection with HCV, comprises two epitopes from different hotspot epitope containing specific peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zettlmeissl G;

The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for isolating Hepatitis C Virus peptides (HPS) which have a binding capacity to a MHC/HLM molecule or a complex comprising the HCV-peptide and the MHC/HLM molecule for preparing a vaccine against HCV infection. The T cells, a T cell clone or a T cell population or preparation is useful for identifying heteroclitic epitopes or for preparing a composition for treating HCV infection. The present sequence represents a synthetic peptide derived from a conserved region of HCV.
                                                                                                                                                                                                                                                                                                                                                                                                           Isolating Hepatitis C Virus peptides (HPs) which have a binding capac: to a MRC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not bind to the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a novel method for isolating Hepatitis C Virus (HCV) peptides (HPS). The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for isolating Hepatitis C Virus peptides (HPS) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the MHC/HLA molecule for preparing a vaccine against HCV infection. The T cells, a T cell clone or a T cell population or preparation is useful for identifying heteroclitic epitopes or for preparing a composition for treating HCV infection. The present sequence represents a synthetic peptide derived from a conserved region of HCV.
                                                                                                                                                      Isolating Hepatitis C Virus peptides (HPs) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not bind to the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolating Hepatitis C Virus peptides (HPs) which have a binding capacity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for isolating Hepatitis C Virus (HCV) peptides (HPS). The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for isolating Hepatitis C Virus peptides (HPS) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the MHC/HLA molecule for preparing a vaccine against HCV infection. The T cells, a T cell clone or a T cell population or preparation is useful for identifying heteroclitic epitopes or for preparing a composition for treating HCV infection. The present sequence represents a synthetic peptide derived from a conserved region of HCV.
                                                                                                                                                                                                                                                                                                                                     capacity
                                                                                                                                                                                                                                                                                                                                 Isolating Hepatitis C Virus peptides (HPs) which have a binding capac: to a MHC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not bind to the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a novel method for isolating Hepatitis C Virus (HCV) peptides (HPs). The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for visolating Hepatitis C Virus peptides (HPs) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the reells, a T cell clone or a T cell population or preparation. The T cells, a T cell clone or a T cell population or preparation is useful for identifying heteroclitic epitopes or for preparing a composition for treating HCV infection. The present sequence represents a synthetic peptide derived from a conserved region of HCV.
to a MHC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not bind to the molecule.
                                                                                                  Example 1; Page 30; 73pp; English.

Isolating Hepatitis C Virus peptides (HPB) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not bind to the molecule.

Example 1; Page 30; 73pp; English.

The invention relates to a novel method for isolating Hepatitis C Virus (HCV) peptides (HPs). The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for isolating Hepatitis C Virus peptides (HPs) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the MHC/HLA molecule for preparing a vaccine against HCV infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for isolating Hepatitis C Virus (HCV) peptides (HPB). The method of the invention has virucide activity, and may be useful in producing a vaccine. The method is useful for isolating Hepatitis C Virus peptides (HPB) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the MHC/HLA molecule for preparing a vaccine against HCV infection. The T cells, a T cell clone or a T cell population or preparation is useful for identifying heteroclitic epicopes or for preparation is useful for treating HCV infection. The present sequence represents a synthetic peptide derived from a conserved region of HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolating Hepatitis C Virus peptides (HPs) which have a binding capacity to a MHC/HLA molecule or a complex comprising the HCV-peptide and the molecule by separating the complex from the HCV-peptides which do not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                               An new immunological agglutination reaction reagent for the diagnosis of hepatitis C uses a HCV antigen polypeptide subjected to heat-treatment. The HCV antigen active polypeptide contains one of the polypeptides given in AAR52735-38
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The polypeptide provokes an antibody response to hepatitis C virus (HCV). It can be produced in large quantities by fusing this coding sequence to the beta-galactoopidase gene and then transforming B. coll with the resulting construct. The E. coli can then be cultured and the fusion protein expressed and recovered from the supernatant. The polypeptide reacts specifically with anti-HCV antibodies and can be used for the identification of such. It can therefore be used to identify individuals infected with HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus; HCV; detection; infection; fusion protein; antibody;

                                                                                                                                                                                                                                           This invention describes a novel attenuated flavivirus live vaccine comprising a flavivirus mutant that has a deletion of at least 4 consecutive amino acids from the capaid protein, provided that the C. terminal hydrophobic region is not affected by the deletion. The vaccine of the invention has virucide, antinflammatory and hepatotropic activity. The attenuated vaccine, and similar nucleic acid vaccines that encode the mutated capaid protein, are useful for protection against a wide range of flavivirus diseases, e.g. yellow fever, Japanese encephalitis, dengue, classical swine fever, bovine viral diarrhoea and hepatitis C. The specified deletion: (i) produces a reliably attenuated virus that does not revert to virulence; (ii) is exactly defined and does not effect immune responses to important proteins; and (iii) can not generate a nontarus virus by recombination. The mutant viruses aliminate the need to produce large amounts of infectious virulent viruses, and can be produced with less expense. The protective response to flavivirus lasts asymificantly longer than that to killed vaccines. This sequence represents a fragment of the capsid protein from Hepatitis c virus (HCV) type 1 described in the disclosure of the invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                         Attenuated flavivirus live vaccine, useful for protection against e.g. yellow fever, comprises virus with attenuating deletion of amino acids from the capsid protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HCV; B1; envelope 1; core protein; HCV genotyping; antibody; vaccine;

                                                                                                                                                                                                DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                 AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated CDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the CDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used cto detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of
                                                                                                                               envelope 1; core protein; HCV genotyping; antibody; vaccine;

Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of

also useful for HCV genotyping. Proteins encoded by the CDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection

Isolated CDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccinas for immunishing against HCV infection. The proteins may also be used to detect amulibodies against HCV in serum, saliva, jumphocytes or other mononuclear cells. The antibodies may be used in the prevention of

DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.
                                                                                                                                                                                                                                                    AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                envelope 1; core protein; HCV genotyping; antibody; vaccine;

Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of

Isolated CDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunishing against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monouclear cells. The antibodies may be used in the prevention of

The present invention describes a recombinant nucleic acid (I) comprising a nucleotide sequence encoding a protein having an avian lysozyme leader peptide, or its functional equivalent, joined to a Hepatitis C virus (HCV) envelope protein or its part. And odescribed: (I) a vector comprising the recombinant nucleic acid; (2) a host cell comprising the recombinant nucleic acid; (2) a host cell comprising the HCV envelope protein or its part in a host cell, comprising transforming the host cell with the recombinant nucleic acid or with the vector, where the host cell is capable of expressing the protein cited above. (I) has hepatotropic, virucide and antiinflammatory activities, and can be used
                                                                                                                                                                                                                                                                                                                                                                                 in gene therapy and vaccines. The recombinant nucleic acid is useful for efficient expression of Hepatitis C virus envelope proteins in eukaryotic cells, such as yeast cells. The HCV envelope proteins may be used as a vaccine, or for incorporation into an immunoassay for the detection of anti-HCV antibodies, and/or genotyping of HCV, for prognosing or monitoring of HCV disease, or as a therapeutic agent. The method is used for producing HCV envelope protein or its part in a host cell. AB084197 to AB084253 and ABP55528 to ABP55568 represent sequences used in the
                                                                            New recombinant nucleic acids for expressing Hepatitis C virus (HCV) envelope proteins in eukaryotic cells, comprising a sequence encoding protein having an avian lysozyme leader peptide joined to the HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hepatitis C virus; HCV; envelope protein; hepatotropic; virucide; antiinflammatory; gene therapy; vaccine.

a nucleotide sequence encoding a protein having an avian lyaczyme leader peptide, or its functional equivalent, joined to a Hepatitis C virus (HCV) envelope protein or its part. Also described: (1) a vector comprising the recombinant nucleic acid; (2) a host cell comprising the recombinant nucleic acid; (3) a method for producing HCV envelope protein or its part in a host cell, comprising transforming the host cell with the recombinant nucleic acid or with the vector, where the host cell with the recombinant nucleic acid or with the vector, where the host cell with the recombinant nucleic acid or with the vector, where the host cell is capable of expressing the protein cited above. (1) has consider the host cell is capable of expressing the protein cited above. (1) has consider the host cell is capable of expressing the protein sin ensed is useful for efficient expression of Hepatitis C virus envelope proteins in enkaryotic cells, such as yeast cells. The HCV envelope proteins may be used as a vaccine, or for incorporation into an immunoassay for the detection of anti-HCV antibodies, and/or genotyping of HCV, for prognosing or anti-HCV antibodies, and/or genotyping of HCV, for prognosing or cells, monitoring of HCV disease, or as a therapeutic agent. The method is used for producing HCV envelope protein or its part in a host cell. ABQ84157 co ABQ84253 and ABB5528 to ABB5528 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                      The present invention describes a recombinant nucleic acid (I) comprising

The present invention describes a recombinant nucleic acid (I) comprising a nucleotide sequence encoding a protein having an avian lysozyme leader peptide, or its functional equivalent, joined to a Hepatitis C virus (HCV) envelope protein or its part. Also described: (I) a vector ecombinant nucleic acid; (2) a host cell comprising the recombinant nucleic acid; (2) a host cell comprising the creombinant nucleic acid or the vector; and (3) a method for producing HCV envelope protein or its part in a host cell; comprising transforming the host cell with the recombinant nucleic acid or with the vector; where the host cell is capable of expressing the protein cited above. (I) has hepatotropic, virucide and antiinflammatory activities, and can be used in gene therapy and vaccines. The HCV envelope proteins in eukaryotic efficient expression of Hepatitis C virus envelope proteins in eukaryotic cells, anch as yeast cells. The HCV envelope proteins may be used as a vaccine, or for incorporation into an immunoassay for the detection of anti-HCV antibodies, and/or genotyping of HCV, for prognosing or cells, and ABDSSSSS and ABDSSSSS Proteins in a host cell. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description

Sequence 178, Application US/08290665A

GENERAL INFORMATION:

APPLICANT: BUTCH, J., MILLER, R.H. AND

APPLICANT: PURCELL, R.H.

TITLE OF INVENTION: NUCLEOTIDE AND DEDUCED

TITLE OF INVENTION: AMINO ACID SEQUENCES OF THE ENVELOPE 1 AND

TITLE OF INVENTION: CORE GENES OF REAGENTS DERIVED FROM THESE

TITLE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES

TITLE OF INVENTION: SEQUENCES 263

CORRESPONDENCE ADDRESS:

ADDRESSEE: MORGAN & FINNEGAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-08-290-665A-181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 5
US-08-290-665A-180

i Sequence 180, Application US/08290665A

patent No. 5882852

GENERAL INFORMATION:

APPLICANT: BURH, J., MILLER, R.H. AND

APPLICANT: PURCELL, R.H.

ITILE OF INVENTION: NUCLEOTIDE AND DEDUCED

ITILE OF INVENTION: AMINO ACID SEQUENCES OF THE ENVELOPE 1 AND

ITILE OF INVENTION: AND THE USE OF INEPATITIS C VIRUS

ITILE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES

NUMBER OF SEQUENCES: 263

NUMBER OF SEQUENCES: 263

ADDRESSEE: MORGAN & FINNEGAN

STREET: 345 PARK AVENUE

CITY: NEW YORK

STATE: NEW YORK

COUNTRY: USA

ZIP: 10154
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                     NUCLEOTIDE AND DEDUCED
NUCLEOTIDE AND DEDUCES OF THE ENVELOPE 1 AND
CORE GENES OF ISOLATES OF HEPATITIS C VIRUS
AND THE USE OF REAGENTS DERIVED FROM THESE
SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-08-290-665A-197

Sequence 197, Application US/08290665A

Sequence 197, Application US/08290665A

Patent No. 5802825

Patent No. 5802825

Patent No. 5802825

TERE OF INVENTION: MULLER, R.H. AND

APPLICANT: PURCELL, R.H.

TITLE OF INVENTION: NUCLEOTIDE AND DEDUCED

TITLE OF INVENTION: CORE GENES OF ISOLATES OF HEPATITIS C VIRUS

TITLE OF INVENTION: AND THE USE OF REAGENTS DERIVED FROM THESE

TITLE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES

NUMBER OF SEQUENCES: 263

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                       ;

Patent No. 655514

GENERAL INFORMATION:

APPLICANT: LEROUX-ROELS, Geert

APPLICANT: DELEXYS, Robert

APPLICANT: MAERTENS, Geert

APPLICANT: MAERTENS, Geert

TITLE OF INVENTION: IMMUNDOMINANT HUMAN T CELL EPITOPES OF HEPATITIS C

TITLE OF INVENTION: VIRUS

FILE REFERENCE: 2752-18

CURRENT APPLICATION NUMBER: US/08/635,886C

CURRENT APPLICATION NUMBER: EP94/03555

PRIOR FILING DATE: 1994-10-28

PRIOR FILING DATE: 1994-11-04

NUMBER OF SEQ ID NOS: 286

SEQ ID NO 202

LENGTH: 319

TYPE: BRT

US-08-974-690C-217

Sequence 217, Application US/08974690C

Betent No. 661333

GENERAL INFORMATION:
APPLICANT: LEROUX-ROLES, Geert
APPLICANT: DELENGY, ROLES,
TITLE OF INVENTION: INMUNOCOMINANT HUMAN T CELL EPITOPES OF HEPATITIS C
TITLE OF INVENTION: INMUNOCOMINANT HUMAN T CELL EPITOPES OF HEPATITIS C
TITLE OF INVENTION: VIRUS
FILE REFERENCE: 2551-94

CURRENT APPLICATION NUMBER: US/08/974,690C

CURRENT PAPLICATION NUMBER: PCT/EP94/03555
PRIOR PILING DATE: 1997-11-19

PRIOR PILING DATE: 1997-11-04

NUMBER OF SEQ ID NOS: 286

SOFTWARE: PATENTIN VERSION 3.1

SEQ ID NO 217

LENGTH: 319

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
